

L^AT_EX Thesis Template of The University of Waterloo

by

Huangrui Mo

A thesis
presented to the University of Waterloo
in fulfillment of the
thesis requirement for the degree of
Doctor of Philosophy
in
Mechanical Engineering

Waterloo, Ontario, Canada, 2014

© Huangrui Mo 2014

Author's Declaration

I hereby declare that I am the sole author of this thesis. This is a true copy of the thesis, including any required final revisions, as accepted by my examiners.

I understand that my thesis may be made electronically available to the public.

Abstract

This is a short brochure on how to write your thesis by using this L^AT_EX template. It's easy, efficient and straightforward. What you need to do, no matter you are familiar with L^AT_EX or not, is to have a try.

Acknowledgements

This work would not be done without the numerous excellent online resources. Many thanks to those who ever contributed or will contribute their knowledge to the open source community.

Nomenclature

Chapter 1

A Brief Guide

1.1 What is L^AT_EX

L^AT_EX (pronounced "Lah-tech" or "Lay-tech") is a macro package created by Leslie Lamport based on T_EX. As a document preparation system for high-quality typesetting in almost any forms of publishing, L^AT_EX is not the name of a particular editing program, but refers to the encoding or tagging conventions that are used in L^AT_EX documents (Wikipedia, 2014; LaTeX, 2014).

1.2 Why use L^AT_EX?

There are a lot of good reasons why you need to use L^AT_EX, the most significant one is the following:

- Allows you to clearly separate the content from the format of your document.
- Let you concentrate on your ideas, not visual appearance!

You can concentrate purely on the structure and contents of your document, not superficial layout issues. You don't need to manually adjust fonts, text sizes, line heights, or text flow for readability, as L^AT_EX takes care of them automatically. (Wikibook, 2014)

Figure 1.1: Comparison between Microsoft Word and L^AT_EX [From Google Images]

1.3 How to use?

1.3.1 Installation

LaTeX is based on open-source code, so it is available on most computing platforms as free software.

- Linux: TeXLive distribution.
- MacOS: Mactex or TeXLive.
- Windows: MikTeX or TeXLive.

Note: the best resource that can be used to learn L^AT_EX is "L^AT_EX Wikibook", which is available online.

Note: to use L^AT_EX, you need a text editor for writing and editing ".tex" files. To open the ".tex" files in this template, you need a text editor which supports "UTF-8" encoding. Free options for different platforms are following:

- Linux: vim.

- MacOS: TeXShop, Macvim.
- Windows: Texmaker, Gvim, Notepad++.

1.3.2 Give a try

After downloading this template and installing a \LaTeX distribution. It's time to have a try:

- Linux: run Compile.sh
- MacOS: run Compile.sh
- Windows: run Compile.bat

Note: It's recommended to use the provided scripts to compile your \LaTeX files. It will automatically search and include files without explicitly specifying relative paths. If you do not use them for compilation, you need to specify the relative path in each " $\text{\textbackslash input{ }}$ " command, or the \LaTeX will complain that it can not find some files.

Note: the bash script "Compile.sh" hasn't been tested on MacOS. If there are some errors, please give me your feedback, thank you so much.

1.3.3 Include math

\LaTeX realization of Equation 1.1 is something like this:

```
\begin{equationa}\label{eq:N-S_equation}
\frac{\partial (\rho \mathbf{v})}{\partial t} +
\nabla \cdot (\rho \mathbf{v} \mathbf{v}) =
-\nabla p + \nabla \cdot \mathbf{T} + \mathbf{f}.
\end{equationa}
```

$$\frac{\partial(\rho \mathbf{v})}{\partial t} + \nabla \cdot (\rho \mathbf{v} \mathbf{v}) = -\nabla p + \nabla \cdot \mathbf{T} + \mathbf{f}. \quad (1.1)$$

1.3.4 Include Graphics

Note: including figures may seem to be scary by looking at the codes. However, the fact is that you only need to modify the names in each part, the rest are simply copy and paste! These codes are all available in the file "Useful Commands.txt".

Figure 1.2 is an example for including a single figure.

```
\begin{figure}[!htbp]
  \centering
  \includegraphics[width=\MyFactor\textwidth]{ITC_Q_Criteria}
  \caption{An Example for including a single figure}
  \label{fig:ITC_Q_Criteria}
\end{figure}
```

Figure 1.3 is an example for including multiple figures.

Figure 1.2: An Example for including a single graph

```
\begin{figure}[!htbp]
  \centering
  \begin{subfigure}[b]{\MySubFactor\textwidth}
```

```

        \includegraphics[width=\textwidth]{HC_OASPL_A}
        \caption{}
        \label{fig:HC_OASPL_A}
    \end{subfigure}%
    ~% add a small space
    \begin{subfigure}[b]{\MySubFactor\textwidth}
        \includegraphics[width=\textwidth]{HC_OASPL_B}
        \caption{}
        \label{fig:HC_OASPL_B}
    \end{subfigure}%
    \\% change line
    \begin{subfigure}[b]{\MySubFactor\textwidth}
        \includegraphics[width=\textwidth]{HC_OASPL_C}
        \caption{}
        \label{fig:HC_OASPL_C}
    \end{subfigure}%
    ~% add a small space
    \begin{subfigure}[b]{\MySubFactor\textwidth}
        \includegraphics[width=\textwidth]{HC_OASPL_D}
        \caption{}
        \label{fig:HC_OASPL_D}
    \end{subfigure}%
    \caption{An Example for including multiple figures}
    \label{fig:HC_OASPL}
\end{figure}

```

1.3.5 Include a citation

Suppose you are going to cite an article named "Document Preparation System", the procedures are:

- Use Google Scholar search "Document Preparation System".
- Open "Cite" and choose "Import to Bibtex" under the target item.
- Copy the citation information of this article into the file "Myrefs.bib"
- Research dominant: cite this article by `\citep{lamport1986document}` like here (Lamport, 1986)

(a)

(b)

(c)

(d)

Figure 1.3: An Example for including multiple figures

- Citation dominant: cite this article by `\citet{lamport1986document}` like here Lamport (1986)
- References list is generated automatically.

1.4 File Tree of Current Template

- Thesis.tex: main tex file, which acts like the main function in C++. No need to modify.
- Style: Store template configuration files, which act like subfunctions, No need to modify.
- Tmp: Store files generated by compilation.
- Biblio: Store information of references.
- Img: Store images.
- Tex: Store files for your content, this is the working directory.
 - Frontpages: content of front pages, like authorship, abstract, etc.
 - Prematter: content of nomenclature, etc.
 - Main_Content: index for chapters you want to include into your current content.
 - Chap_***: your content for each chapters.
 - Appendix: appendix.
 - Useful Commands: collection of useful commands.

Note: this template can be easily adapted to other writing purposes such as articles. What you need to do is to change and adjust a few items in the "Thesis.tex" file, which would be very easy after you are a little familiar with using \LaTeX . Like :

Change `\documentclass{uwaterloothesis}` to `\documentclass{article}`

1.5 Feedback and Problems

Please feel free to send me emails for any related problems:

huangrui.mo@uwaterloo.ca
